1 Overview

1.1 Main function description

RKNN-Toolkit2 is a development kit that provides users with model conversion, inference and performance evaluation on PC and Rockchip NPU platforms. Users can easily complete the following functions through the Python interface provided by the tool:

- 1) Model conversion: support to convert Caffe / TensorFlow / TensorFlow Lite / ONNX / Darknet / Pytorch model to RKNN model, support RKNN model import/export, which can be used on Rockchip NPU platform later.
- 2) Quantization: support to convert float model to quantization model, currently support quantized methods including asymmetric quantization (asymmetric_quantized-8, asymmetric_quantized-16). and support hybrid quantization. **Asymmetric_quantized-16 and hybrid quantization Not supported yet.**
- 3) Model inference: Able to simulate Rockchip NPU to run RKNN model on PC and get the inference result. This tool can also distribute the RKNN model to the specified NPU device to run, and get the inference results.
- 4) Performance evaluation: can distribute the RKNN model to the specified NPU device to run, and evaluate the model performance in the actual device. **Not supported yet.**
- 5) Memory evaluation: Evaluate system and NPU memory consumption at runtime of the model. When using this function, the RKNN model must be distributed to the NPU device to run, and then call the relevant interface to obtain memory information. **Not supported yet.**
- 6) Quantitative error analysis: This function will give the Euclidean or cosine distance of each layer of inference results before and after the model is quantized. This can be used to analyze how quantitative error occurs, and provide ideas for improving the accuracy of quantitative models.

Note: Some features are limited by the operating system or chip platform and cannot be used on

some operating systems or platforms. The feature support list of each operating system (platform) is as follows:

	Ubuntu 18.04	Windows 7/10	Debian 9.8 / 10 (ARM 64)	MacOS Mojave / Catalina
Model conversion	yes			
Quantization	yes			
Model inference	yes			
Performance evaluation				
Memory evaluation				
Multiple inputs	yes			
Batch inference				
List devices				
Query SDK version				
Quantitative error analysis	yes			
Visualization				
Model optimization level	yes			

1.2 Applicable chip model

- RK3566
- RK3568

1.3 Applicable Operating System

RKNN Toolkit2 is a cross-platform development kit. The supported operating systems are as follows:

- Ubuntu: 18.04 (x64) or later

Rockchip

2 Requirements/Dependencies

It is recommended to meet the following requirements in the operating system environment:

Table 1 Operating system environment

Operating system version	Ubuntu18.04(x64)or later
Python version	3.6
Python library dependencies	<code>numpy==1.16.6</code> <code>onnx==1.7.0</code> <code>onnxoptimizer==0.1.0</code> <code>onnxruntime==1.5.2</code> <code>tensorflow==1.14.0</code> <code>tensorboard==1.14.0</code> <code>protobuf==3.12.0</code> <code>torch==1.6.0</code> <code>torchvision==0.7.0</code> <code>mxnet==1.7.0</code> <code>psutil==5.6.2</code> <code>ruamel.yaml==0.15.81</code> <code>scipy==1.2.1</code> <code>tqdm==4.27.0</code> <code>requests==2.21.0</code> <code>tflite==2.3.0</code> <code>opencv-python==4.4.0.46</code>

Note:

1. This document mainly uses Ubuntu 18.04 / Python3.6 as an example. For other operating systems, please refer to the corresponding quick start guide:

<Rockchip_Quick_Start_RKNN_Toolkit2_EN.pdf>.

3 User Guide

3.1 Installation

There are two ways to install RKNN-Toolkit2: one is through the Python package installation and management tool pip, the other is running docker image with full RKNN-Toolkit2 environment. The specific steps of the two installation ways are described below.

3.1.1 Install by pip command

1. Create virtualenv environment. If there are multiple versions of the Python environment in the system, it is recommended to use virtualenv to manage the Python environment.

```
sudo apt install virtualenv
sudo apt-get install python3 python3-dev python3-pip
sudo apt-get install libxslt1-dev zlib1g zlib1g-dev libglib2.0-0 \
libsm6 libgl1-mesa-glx libprotobuf-dev gcc

virtualenv -p /usr/bin/python3 venv
source venv/bin/activate
```

2. Install dependent libraries:

```
pip3 install -r doc/requirements.txt
```

Note: RKNN-Toolkit2 itself does not rely on opencv-python, but the example will use this library to load image, so the library is also installed here.

3. Install RKNN-Toolkit2

```
pip install package/rknn_toolkit2*.whl
```

Please select corresponding installation package (located at the *packages/* directory) according to different python versions and processor architectures:

- **Python3.6 for x86_64:** rknn_toolkit2-0.6.0-cp36-cp36m-linux_x86_64.whl

3.1.2 Install by the Docker Image

In docker folder, there is a Docker image that has been packaged for all development requirements, Users only need to load the image and can directly use RKNN-toolkit2, detailed steps are as follows:

1. Install Docker

Please install Docker according to the official manual:

<https://docs.docker.com/install/linux/docker-ce/ubuntu/>

2. Load Docker image

Execute the following command to load Docker image:

```
docker load --input rknn-toolkit2-0.6.0-docker.tar.gz
```

After loading successfully, execute "docker images" command and the image of rknn-toolkit2 appears as follows:

REPOSITORY	TAG	IMAGE ID	CREATED	SIZE
rknn-toolkit2	0.6.0	4f6bae6686d8	1 hours ago	4.13GB

3. Run image

Execute the following command to run the docker image. After running, it will enter the bash environment.

```
docker run -t -i --privileged -v /dev/bus/usb:/dev/bus/usb rknn-toolkit2:0.6.0 /bin/bash
```

If you want to map your own code, you can add the "-v <host src folder>:<image dst folder>" parameter, for example:

```
docker run -t -i --privileged -v /dev/bus/usb:/dev/bus/usb -v /home/rk/test:/test rknn-toolkit2:0.6.0 /bin/bash
```

4. Run demo

```
cd /example/tflite/mobilenet_v1  
python test.py
```

3.2 Usage of RKNN-Toolkit2

Next, the use process of RKNN Toolkit2 under each use scenario will be given in detail.

3.2.1 Scenario 1: Inference for Simulation on PC

In this scenario, RKNN Toolkit2 runs on the PC, and runs the model through the simulated to realize different functions.

Depending on the type of model, this scenario can be divided into two sub-scenarios: one scenario is that the model is a non-RKNN model, i.e. Caffe, TensorFlow, TensorFlow Lite, ONNX, Darknet, Pytorch model, and the other scenario is that the model is an RKNN model which is a proprietary model of Rockchip with the file suffix "rknn".

Note: Simulator only supported on x86_64 Linux.

3.2.1.1 run the non-RKNN model

When running a non-RKNN model, the RKNN-Toolkit2 usage flow is shown below:

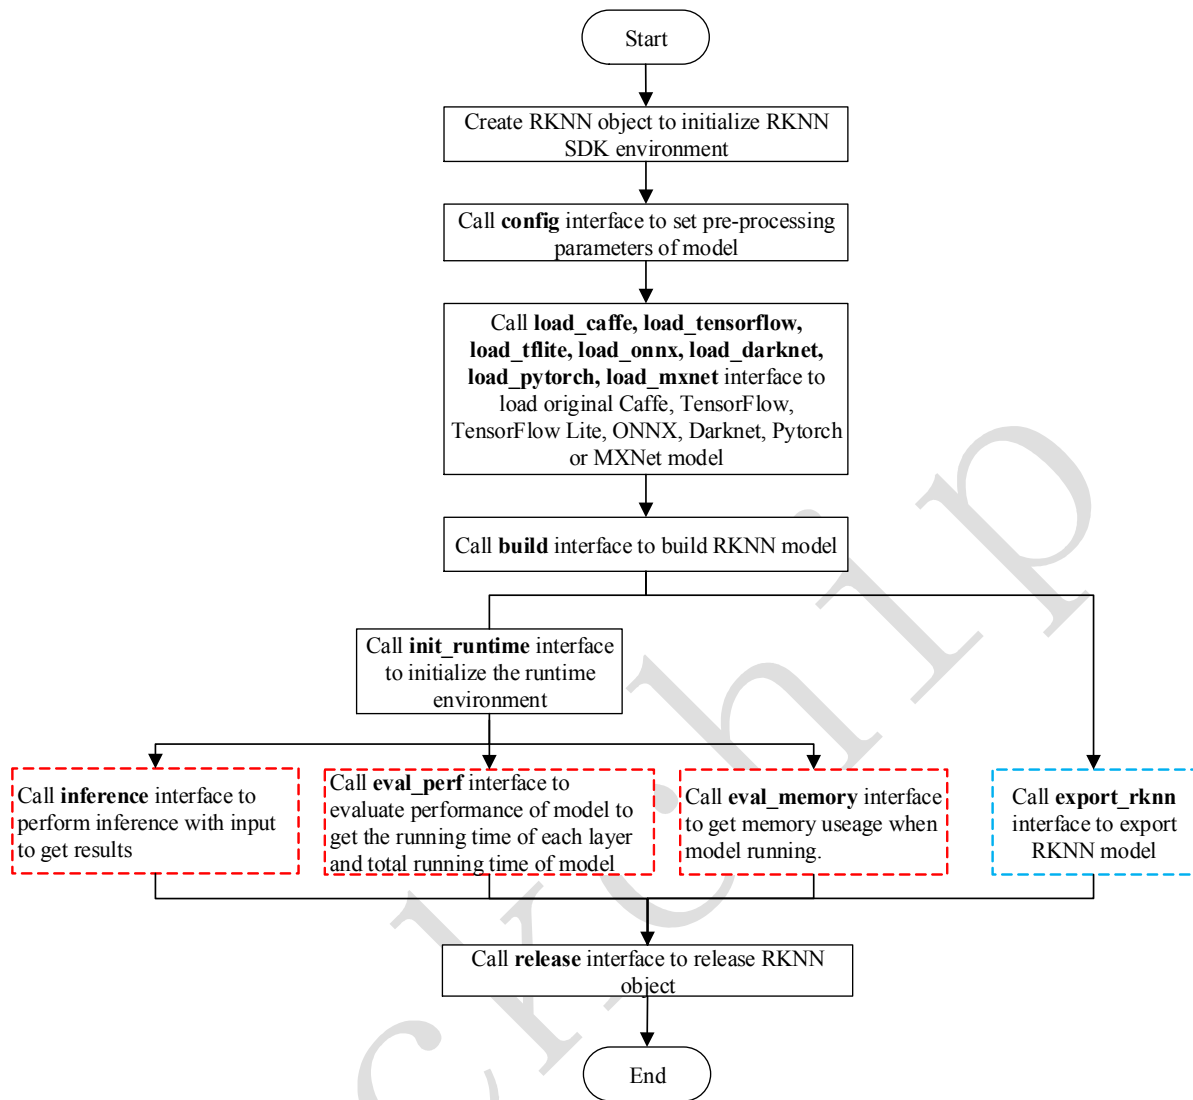

Figure 1 Usage flow of RKNN-Toolkit2 when running a non-RKNN model on PC

Note:

1. The above steps should be performed in order.
2. The model exporting step marked in the blue box is not necessary. If you exported, you can use `load_rknn` to load it later on.
3. The order of model inference, performance evaluation and memory evaluation steps marked in red box is not fixed, it depends on the actual demand. **performance evaluation and memory evaluation is not supported yet.**
4. Only when the target hardware platform is Rockchip NPU, we can call `inference` / `eval_perf` / `eval_memory` interface. **Not supported yet.**

3.2.2 Scenario 2: Run on Rockchip NPU connected to the PC.

Not supported yet.

Rockchip NPU platforms currently supported by RKNN Toolkit2 include RK3566, RK3568.

In this Scenario, In this scenario, RKNN Toolkit2 runs on the PC and connects to the NPU device through the PC's USB. RKNN Toolkit2 transfers the RKNN model to the NPU device to run, and then obtains the inference results, performance information, etc. from the NPU device

First, we need to complete the following two steps:

1. Make sure the USB OTG of development board is connected to PC, and call `list_devices` interface will show the device. More information about "list_devices" interface can see Section 3.5.15.

2. "Target" parameter and "device_id" parameter need to be specified when calling "init_runtime" interface to initialize the runtime environment, where "target" indicates the type of hardware, optional values are "rk3566" and "rk3568". When multiple devices are connected to PC, "device_id" parameter needs to be specified. It is a string which can be obtained by calling "list_devices" interface, for example:

```
all device(s) with adb mode:
[]
all device(s) with ntb mode:
['TB-rk3566S0', '515e9b401c060c0b']
```

Runtime initialization code is as follows:

```
# RK3566
ret = init_runtime(target='rk3366', device_id='VGEJY9PW7T')

# RK3568
ret = init_runtime(target='rk3568', device_id='515e9b401c060c0b')
```

3.2.2.1 run the non-RKNN model

If the model is a non-RKNN model (Caffe, TensorFlow, TensorFlow Lite, ONNX, Darknet, Pytorch), the usage flow and precautions of RKNN-Toolkit2 are the same as the sub-scenario 1 of the scenario

1(see Section 3.2.1.1).

3.2.2.2 run the RKNN model

When running an RKNN model, users do not need to set model pre-processing parameters, nor do they need to build an RKNN model, the usage flow is shown in the following figure.

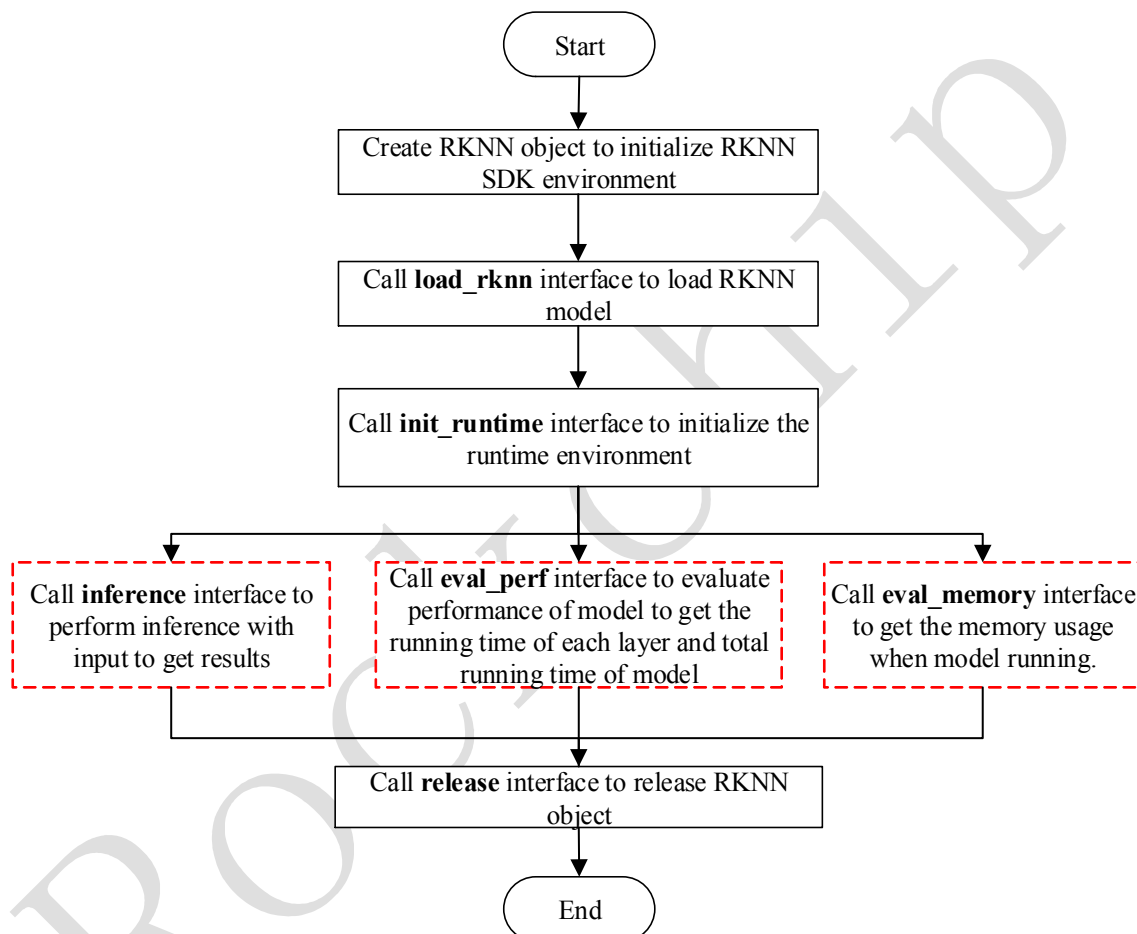

Figure 2 Usage flow of RKNN-Toolkit2 when running an RKNN model on PC

Note:

1. The above steps should be performed in order.
2. The order of model inference, performance evaluation and memory evaluation steps marked in red box is not fixed, it depends on the actual demand.
3. We can call inference / eval_perf / eval_memory only when the target is hardware platform.
4. The import method through load_rknn is only used for the use of hardware platform-related

functions, and functions such as `accuracy_analysis` cannot be used.

3.2.3 Scenario 3: Inference on RK356x Linux development board

Not supported yet.

In this scenario, RKNN-Toolkit2 is installed in RK356x Linux system directly. The built or imported RKNN model runs directly on RK356x to obtain the actual inference results or performance information of the model.

For RK356x Linux development board, the usage flow of RKNN-Toolkit2 depends on the type of model. If the model is a non-RKNN model, the usage flow is the same as that in the sub-scenario 1 of scenario 1 (see [Section 3.2.1.1](#)), otherwise, please refer to the usage flow in the sub-scenario 2 of scenario 1 (see [Section 3.2.2.2](#)).

3.3 Hybrid Quantization

Not supported yet.

The quantization feature can minimize model accuracy based on improved model performance. But for some models, the accuracy has dropped a bit. In order to allow users to better balance performance and accuracy, we add new feature hybrid quantization. Users can decide which layers to quantize or not to quantize. Users can also modify the quantization parameters according to their own experience.

Note:

1. The `examples/common_function_demos` directory provides a hybrid quantization example named `hybrid_quantization`. Users can refer to this example for hybrid quantification practice.

3.3.1 Instructions of hybrid quantization

Currently, RKNN Toolkit2 has three kind of ways to use hybrid quantization:

1. Convert quantized layer to non-quantized (e.g. float16) layer. This way may improve accuracy, but performance will drop.

3.3.2 Hybrid quantization profile

When using the hybrid quantization feature, the first step is to generate a hybrid quantization profile, which is briefly described in this section.

When the hybrid quantization interface `hybrid_quantization_step1` is called, a configuration file of `{model_name}.quantization.cfg` is generated in the current directory. The configuration file format is as follows:

```
custom_quantize_layers: {}
quantize_parameters:
  FeatureExtractor/MobilenetV2/Conv/BatchNorm/batchnorm/add_1:0:
    qtype: asymmetric_quantized
    qmethod: layer
    dtype: int8
    min:
      - 0.0
    max:
      - 6.0
    scale:
      - 0.023529411764705882
    zero_point:
      - -128
    ori_min:
      - -13.971162796020508
    ori_max:
      - 22.79466438293457
    .....
```

The first line of the body of the configuration file is a dictionary of customized quantize layers, add the layer names and their corresponding quantized type (choose from **float16** / **int16**) to be changed to customized quantize layers.

Next is the quantization parameter of each operand in the model, and each operand is a dictionary. The key of each dictionary is `tensor_name`, the value of dictionary is quantization parameter, if it is not quantized, the "dtype" value is float16.

3.3.3 Usage flow of hybrid quantization

When using the hybrid quantization function, it can be done in four steps.

Step1, load the original model and generate a quantize configuration file, a model structure file and a model weight bias file. The specific interface call process is as follows:

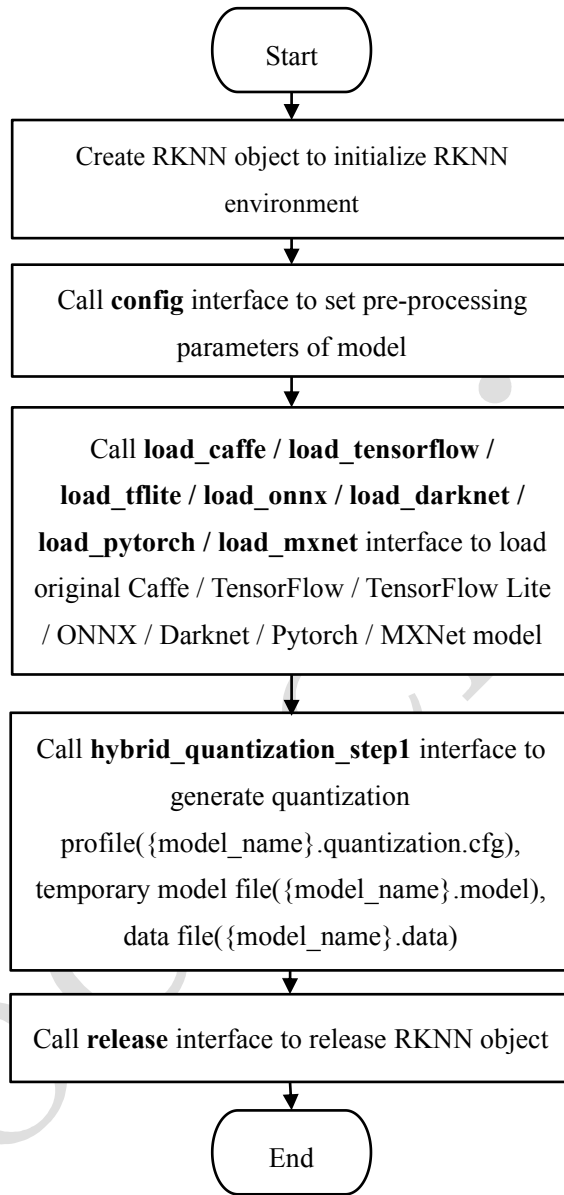

Figure 3 call process of hybrid quantization step 1

Step 2, Modify the quantization configuration file generated in the first step.

- If some quantization layers is changed to a non-quantization layer, find the output operand of layer that is not to be quantized, and add these operands name and float16 to custom_quantize_layers, such as "<operands name>: float16".

Step 3, generate hybrid quantized RKNN model. The specific interface call flow is as follows:

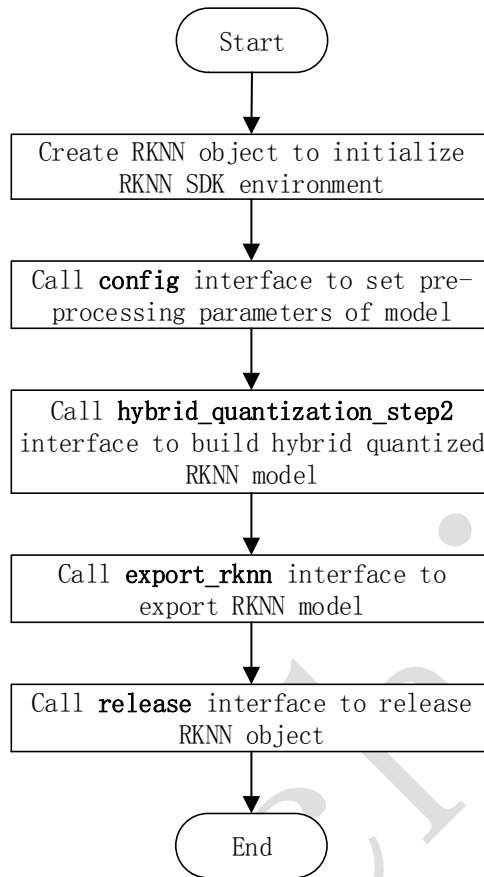

Figure 4 call process of hybrid quantization step 3

Step 4, use the RKNN model generated in the previous step to inference.

3.4 Example

The following is the sample code for loading TensorFlow Lite model (see the *example/tflite/mobilenet_v1* directory for details), if it is executed on PC, the RKNN model will run on the simulator.

```
import numpy as np
import cv2
from rknn.api import RKNN

def show_outputs(outputs):
    output = outputs[0][0]
    output_sorted = sorted(output, reverse=True)
    top5_str = 'mobilenet_v1\n-----TOP 5-----\n'
    for i in range(5):
        value = output_sorted[i]
        index = np.where(output == value)
```

```
        for j in range(len(index)):
            if (i + j) >= 5:
                break
            if value > 0:
                topi = '{}: {} \n'.format(index[j], value)
            else:
                topi = '-1: 0.0 \n'
            top5_str += topi
        print(top5_str)

if __name__ == '__main__':

    # Create RKNN object
    rknn = RKNN()

    # pre-process config
    print('--> config model')
    rknn.config(mean_values=[128, 128, 128], std_values=[128, 128, 128],
reorder_channel=False)
    print('done')

    # Load tensorflow model
    print('--> Loading model')
    ret = rknn.load_tflite(model='mobilenet_v1_1.0_224.tflite')
    if ret != 0:
        print('Load mobilenet_v1 failed!')
        exit(ret)
    print('done')

    # Build model
    print('--> Building model')
    ret = rknn.build(do_quantization=True, dataset='./dataset.txt')
    if ret != 0:
        print('Build mobilenet_v1 failed!')
        exit(ret)
    print('done')

    # Export rknn model
    print('--> Export RKNN model')
    ret = rknn.export_rknn('./mobilenet_v1.rknn')
    if ret != 0:
        print('Export mobilenet_v1.rknn failed!')
        exit(ret)
    print('done')

    # Set inputs
    img = cv2.imread('./dog_224x224.jpg')
    img = cv2.cvtColor(img, cv2.COLOR_BGR2RGB)
    img = np.expand_dims(img, 0)
```

```

# init runtime environment
print('--> Init runtime environment')
ret = rknn.init_runtime()
if ret != 0:
    print('Init runtime environment failed')
    exit(ret)
print('done')

# Inference
print('--> Running model')
outputs = rknn.inference(inputs=[img])
show_outputs(outputs)
print('done')

rknn.release()

```

Where dataset.txt is a text file containing the path of the test image. For example, if a picture of dog_224x224.jpg in the *example/tflite/mobilenet_v1* directory, then the corresponding content in dataset.txt is as follows:

```
dog_224x224.jpg
```

When performing model inference, the result of this demo is as follows:

```

-----TOP 5-----
[156]: 0.8544921875
[155]: 0.080322265625

[194]: 0.0025787353515625

```

3.5 RKNN-Toolkit2 API description

3.5.1 RKNN object initialization and release

The initialization/release function group consists of API interfaces to initialize and release the RKNN object as needed. The **RKNN()** must be called before using all the API interfaces of RKNN-Toolkit2, and call the **release()** method to release the object when task finished.

When the RKNN object is initing, the users can set *verbose* and *verbose_file* parameters, used to show detailed log information of model loading, building and so on. The data type of verbose parameter is bool.

If the value of this parameter is set to True, the RKNN Toolkit2 will show detailed log information on

screen. The data type of `verbose_file` is string. If the value of this parameter is set to a file path, the detailed log information will be written to this file (**the `verbose` also need be set to `True`**). The model conversion also supports the `verbose` parameter value "INFO", which will output all parsing logs during the model parsing process to the screen. This will help to troubleshoot which layer parse failed and facilitate problem location.

The sample code is as follows:

```
# Show the detailed log information on screen, and saved to
# mobilenet_build.log
rknn = RKNN(verbose=True, verbose_file='./mobilenet_build.log')
# Only show the detailed log information on screen.
rknn = RKNN(verbose=True)
...
rknn.release()
```

3.5.2 RKNN model configuration

Before the RKNN model is built, the model needs to be configured first through the **config** interface.

API	config
Description	Set model parameters
Parameter	<code>batch_size</code> : The size of each batch of data sets. The default value is 100. When quantifying, the amount of data fed in each batch will be determined according to this parameter to correct the quantization results.
	<code>mean_values</code> : The mean values of the input. The parameter format is a list. The list contains one or more mean sublists. The multi-input model corresponds to multiple sublists. The length of each sublist is consistent with the number of channels of the input. For example, if the parameter is <code>[[128,128,128]]</code> , it means an input subtract 128 from the values of the three channels. If <code>reorder_channel</code> is set to <code>True</code> , the channel adjustment will be done first, and then the average value will be subtracted.
	<code>std_values</code> : The normalized value of the input. The parameter format is a list. The list

	<p>contains one or more normalized value sublists. The multi-input model corresponds to multiple sublists. The length of each sublist is consistent with the number of channels of the input. For example, if the parameter is <code>[[128,128,128]]</code>, it means the value of the three channels of an input minus the average value and then divide by 128. If <code>reorder_channel</code> is set to <code>True</code>, the channel adjustment will be performed first, followed by subtracting the mean value and dividing by the normalized value.</p>
	<p><code>epochs</code>: Number of iterations in quantization. Quantization parameter calibration is performed with specified data at each iteration. Default value is -1, in this situation, the number of iteration is automatically calculated based on the amount of data in the dataset.</p> <p>Not support yet.</p>
	<p><code>reorder_channel</code>: A permutation of the dimensions of input image (for three-channel input only, other channel formats can be ignored). The new tensor dimension <code>i</code> will correspond to the original input dimension <code>reorder_channel[i]</code>. For example, if the original image is RGB format, <code>True</code> indicates that it will be converted to BGR.</p> <p>If there are multiple inputs, the corresponding parameters for each input is split with <code>'</code>, such as <code>[True, True, False]</code>.</p>
	<p><code>quantized_dtype</code>: Quantization type, the quantization types currently supported are <code>asymmetric_quantized-8</code>, <code>asymmetric_quantized-16</code>. The default value is <code>asymmetric_quantized-8</code>. <code>asymmetric_quantized-16</code> is not supported yet.</p>
	<p><code>quantized_algorithm</code>: The quantization algorithm used when calculating the quantization parameters of each layer. Currently support: <code>normal</code>, <code>mmse</code>. Default is <code>normal</code>. <code>mmse</code> is not supported yet.</p>
	<p><code>quantized_method</code>: Currently support <code>layer</code> or <code>channel</code>, That is each layer has only one set of quantization parameters or each channel has its own set of quantization parameters. Usually the channel will be more accurate than the layer, default is <code>layer</code>.</p> <p><code>channel</code> is not supported yet.</p>

	<p>optimization_level: Model optimization level. By modifying the model optimization level, you can turn off some or all of the optimization rules used in the model conversion process. The default value of this parameter is 3, and all optimization options are turned on. When the value is 2 or 1, turn off some optimization options that may affect the accuracy of some models. Turn off all optimization options when the value is 0.</p> <p>target_platform: Specify which target chip platform the RKNN model is based on. RK3566 and RK3568 are currently supported.</p>
Return Value	None

The sample code is as follows:

```
# model config
rknn.config(mean_values=[[103.94, 116.78, 123.68]],
            std_values=[[58.82, 58.82, 58.82]],
            reorder_channel=True,
            target_platform='rk3566')
```

3.5.3 Loading non-RKNN model

RKNN-Toolkit2 currently supports Caffe, TensorFlow, TensorFlow Lite, ONNX, Darknet, Pytorch seven kinds of non-RKNN models. There are different calling interfaces when loading models, the loading interfaces of these seven models are described in detail below.

3.5.3.1 Loading Caffe model

API	load_caffe
Description	Load Caffe model
Parameter	<p>model: The path of Caffe model structure file (suffixed with ".prototxt").</p> <p>proto: Caffe model format (valid value is 'caffe' or 'lstm_caffe'). Please use 'lstm_caffe' when the model is RNN model. 'lstm_caffe' is not supported yet.</p>

	blobs: The path of Caffe model binary data file (suffixed with ".caffemodel"). The value can be None, RKNN Toolkit2 will randomly generate parameters such as weights.
	inputname: When the caffe model has multiple inputs, you can specify the order of the input layer names through this parameter, such as ['input1','input2','input3'],note that the name needs to be consistent with the model input name; It can also be set default. The sequence is automatically given by the caffe model file (file suffix with .prototxt).
Return	0: Import successfully
Value	-1: Import failed

The sample code is as follows:

```
# Load the mobilenet_v2 Caffe model in the current path
ret = rknn.load_caffe(model='./mobilenet_v2.prototxt',
                      proto='caffe',
                      blobs='./mobilenet_v2.caffemodel')
```

3.5.3.2 Loading TensorFlow model

API	load_tensorflow
Description	Load TensorFlow model
Parameter	tf_pb: The path of TensorFlow model file (suffixed with ".pb").
	inputs: The input node of model, input with multiple nodes is supported now. All the input node string are placed in a list.
	input_size_list: The size and number of channels of the image corresponding to the input node. As in the example of mobilenet_v1 model, the input_size_list parameter should be set to [[224,224,3]].
	outputs: The output node of model, output with multiple nodes is supported now. All the output nodes are placed in a list.
	predef_file: In order to support some controlling logic, a predefined file in npz format needs to be provided. This predefined file can be generated by the following function call:

	np.savez('prd.npz', [placeholder name]=prd_value).If there are / in placeholder name, use # to replace. Not supported yet.
Return	0: Import successfully
value	-1: Import failed

The sample code is as follows:

```
# Load ssd_mobilenet_v1_coco_2017_11_17 TF model in the current path
ret = rknn.load_tensorflow(
    tf_pb='./ssd_mobilenet_v1_coco_2017_11_17.pb',
    inputs=['FeatureExtractor/MobilenetV1/MobilenetV1/Conv2d_0
           /BatchNorm/batchnorm/mul_1'],
    outputs=['concat', 'concat_1'],
    input_size_list=[[300, 300, 3]])
```

3.5.3.3 Loading TensorFlow Lite model

API	load_tflite
Description	Load TensorFlow Lite model.
Parameter	model: The path of TensorFlow Lite model file (suffixed with ".tflite").
Return	0: Import successfully
Value	-1: Import failed

The sample code is as follows:

```
# Load the mobilenet_v1 TF-Lite model in the current path
ret = rknn.load_tflite(model = './mobilenet_v1.tflite')
```

3.5.3.4 Loading ONNX model

API	load_onnx
Description	Load ONNX model
Parameter	model: The path of ONNX model file (suffixed with ".onnx")
Return	0: Import successfully

Value	-1: Import failed
-------	-------------------

The sample code is as follows:

```
# Load the arcface onnx model in the current path
ret = rknn.load_onnx(model = './arcface.onnx')
```

3.5.3.5 Loading Darknet model

API	load_darknet
Description	Load Darknet model
Parameter	model: The path of Darknet model structure file (suffixed with ".cfg").
	weight: The path of weight file (suffixed with ".weight").
Return	0: Import successfully
Value	-1: Import failed

The sample code is as follows:

```
# Load the yolov3-tiny darknet model in the current path
ret = rknn.load_darknet(model = './yolov3-tiny.cfg',
                        weight= './yolov3.weights')
```

3.5.3.6 Loading Pytorch model

API	load_pytorch
Description	Load Pytorch model
Parameter	model:The path of Pytorch model structure file (suffixed with ".pt"), and need a model in the torchscript format. Required.
	input_size_list:The size and number of channels of each input node. For example, [[1,1,224,224],[1,3,224,224]] means there are two inputs. One of the input shapes is [1,1, 224, 224], and the other input shape is [1,3, 224, 224]. Required.
Return	0: Import successfully

Value	-1: Import failed
-------	-------------------

The sample code is as follows:

```
# Load the pytorch model resnet18 in the current path
ret = rknn.load_pytorch(model = './resnet18.pt',
                        input_size_list=[[1,3,224,224]])
```

3.5.3.7 Loading MXNet model(Not support yet)

API	load_mxnet
Description	Load MXNet model
Parameter	symbol:Network structure file of MXNet model, suffixed with ".json". Required.
	params:Network parameters file of MXNet model, suffixed with ".params". Required.
	input_size_list:The size and number of channels of each input node. For example, [[1,1,224,224],[1,3,224,224]] means there are two inputs. One of the input shapes is [1,1, 224, 224], and the other input shape is [1,3, 224, 224]. Required.
Return	0: Import successfully
Value	-1: Import failed

The sample code is as follows:

```
# Load the mxnet model resnext50 in the current path
ret = rknn.load_mxnet(symbol='resnext50_32x4d-symbol.json',
                      params='resnext50_32x4d-4ecf62e2.params',
                      input_size_list=[[1,3,224,224]])
```

3.5.4 Building RKNN model

API	build
Description	Build corresponding RKNN model according to imported model.
Parameter	do_quantization: Whether to quantize the model, optional values are True and False.

	<p>dataset: A input data set for rectifying quantization parameters. Currently supports text file format, the user can place the path of picture(jpg or png) or npy file which is used for rectification. A file path for each line. Such as:</p> <pre>a.jpg b.jpg or a.npy b.npy</pre> <p>If there are multiple inputs, the corresponding files are divided by space. Such as:</p> <pre>a.jpg a2.jpg b.jpg b2.jpg or a.npy a2.npy b.npy b2.npy</pre>
	<p>rknn_batch_size: Not support yet</p> <p>batch size of input, default is 1. If greater than 1, NPU can inference multiple frames of input image or input data in one inference. For example, original input of MobileNet is [1, 224, 224, 3], output shape is [1, 1001]. When rknn_batch_size is set to 4, the input shape of MobileNet becomes [4, 224, 224, 3], output shape becomes [4, 1001].</p> <p>Note:</p> <ol style="list-style-type: none"> The adjustment of rknn_batch_size does not improve the performance of the general model on the NPU, but it will significantly increase memory consumption and increase the delay of single frame. The adjustment of rknn_batch_size can reduce the consumption of the ultra-small model on the CPU and improve the average frame rate of the

	<p>ultra-small model. (Applicable to the model is too small, CPU overhead is greater than the NPU overhead)</p> <p>3. The value of rknn_batch_size is recommended to be less than 32, to avoid the memory usage is too large and the reasoning fails.</p> <p>4. After the rknn_batch_size is modified, the shape of input and output will be modified. So the inputs of inference should be set to correct size. It's also needed to process the returned outputs on post processing.</p>
Return	0: Build successfully
value	-1: Build failed

The sample code is as follows:

```
# Build and quantize RKNN model
ret = rknn.build(do_quantization=True, dataset='./dataset.txt')
```

3.5.5 Export RKNN model

The RKNN model built by the previous interface can be saved as a file, and then if you want to use the model to perform inference on the hardware, you can load the model directly through the **load_rknn** interface, or directly deploy to the hardware platform.

API	export_rknn
Description	Save RKNN model in the specified file (suffixed with ".rknn").
Parameter	export_path: The path of generated RKNN model file.
Return	0: Export successfully
Value	-1: Export failed

The sample code is as follows:

```
# save the built RKNN model as a mobilenet_v1.rknn file in the current # path
ret = rknn.export_rknn(export_path = './mobilenet_v1.rknn')
```

3.5.6 Loading RKNN model

API	load_rknn
Description	Load RKNN model. The loading model is limited to connecting to the NPU hardware for inference or performance data acquisition. It can not be used for simulator or accuracy analysis.
Parameter	path: The path of RKNN model file.
	load_model_in_npu: Whether to load RKNN model in NPU directly. The path parameter should fill in the path of the model in NPU. It can be set to True only when RKNN-Toolkit2 run on RK356x Linux or NPU device(RK356x, rk3566 or TB-rk3566 AI Compute Stick) is connected. Default value is False. Not supported yet.
Return	0: Load successfully
Value	-1: Load failed

The sample code is as follows:

```
# Load the mobilenet_v1 RKNN model in the current path
ret = rknn.load_rknn(path='./mobilenet_v1.rknn')
```

3.5.7 Initialize the runtime environment

Before inference or performance evaluation, the runtime environment must be initialized. This interface determines which type of runtime hardware is specified to run model or run in simulator.

API	init_runtime
Description	Initialize the runtime environment. Set the device information (hardware platform, device ID). Determine whether to enable debug mode to obtain more detailed performance information for performance evaluation.
Parameter	target: Target hardware platform, now supports "RK3566", "RK3568". The default value is "None", which indicates model runs on simulator. Currently RK3566/RK3568 not

	supported yet.
	<p>device_id: Device identity number, if multiple devices are connected to PC, this parameter needs to be specified which can be obtained by calling "<i>list_devices</i>" interface. The default value is "None".</p> <p>Not Supported yet.</p>
	<p>perf_debug: Debug mode option for performance evaluation. In debug mode, the running time of each layer can be obtained, otherwise, only the total running time of model can be given. The default value is False.</p> <p>Not Supported yet.</p>
	<p>eval_mem: Whether enter memory evaluation mode. If set True, the eval_memory interface can be called later to fetch memory usage of model running. The default value is False.</p> <p>Not Supported yet.</p>
	<p>async_mode: Whether to use asynchronous mode. When calling the inference interface, it involves setting the input picture, model running, and fetching the inference result. If the asynchronous mode is enabled, setting the input of the current frame will be performed simultaneously with the inference of the previous frame, so in addition to the first frame, each subsequent frame can hide the setting input time, thereby improving performance. In asynchronous mode, the inference result returned each time is the previous frame. The default value for this parameter is False.</p> <p>Not Supported yet.</p>
Return	0: Initialize the runtime environment successfully
Value	-1: Initialize the runtime environment failed

The sample code is as follows:

```
# Initialize the runtime environment
ret = rknn.init_runtime(target='rk3566', device_id='012345789AB')
if ret != 0:
```

```
print('Init runtime environment failed')
exit(ret)
```

3.5.8 Inference with RKNN model

This interface kicks off the RKNN model inference and get the result of inference.

API	inference
Description	<p>Use the model to perform inference with specified input and get the inference result.</p> <p>Detailed scenarios are as follows:</p> <ol style="list-style-type: none">1. If RKNN Toolkit2 is running on PC and the target is set to Rockchip NPU when initializing the runtime environment, the inference of model is performed on the specified hardware platform.2. If RKNN Toolkit2 is running on PC and the target is not set when initializing the runtime environment, the inference of model is performed on the simulator.
Parameter	inputs: Inputs to be inferred, such as images processed by cv2. The object type is ndarray list.
	data_format: The shape format of input data. Optional values are "nchw", "nhwc". The default value is 'nhwc'.
	inputs_pass_through: Pass the input transparently to the NPU driver. In non-transparent mode, the tool will reduce the mean, divide the variance, etc. before the input is passed to the NPU driver; in transparent mode, these operations will not be performed. The value of this parameter is an array. For example, to pass input0 and not input1, the value of this parameter is [1, 0]. The default value is None, which means that all input is not transparent.
Return Value	results: The result of inference, the object type is ndarray list.

The sample code is as follows:

For classification model, such as mobilenet_v1, the code is as follows (refer to

example/tfite/mobilenet_v1 for the complete code):

```
# Perform inference for a picture with a model and get a top-5 result
.....
outputs = rknn.inference(inputs=[img])
show_outputs(outputs)
.....
```

The result of top-5 is as follows:

```
-----TOP 5-----
[156]: 0.85107421875
[155]: 0.09173583984375
[205]: 0.01358795166015625
[284]: 0.006465911865234375
[194]: 0.002239227294921875
```

For object detection model, such as *ssd_mobilenet_v1*, the code is as follows (refer to *example/tensorflow/ssd_mobilenet_v1* for the complete code):

```
# Perform inference for a picture with a model and get the result of object
# detection
.....
outputs = rknn.inference(inputs=[image])
.....
```

After the inference result is post-processed, the final output is shown in the following picture (the color of the object border is randomly generated, so the border color obtained will be different each time):

Figure 3 ssd_mobilenet_v1 inference result

3.5.9 Evaluate model performance

Not supported yet.

3.5.10 Evaluating memory usage

Not supported yet.

3.5.11 Get SDK version

Not supported yet.

3.5.12 Hybrid Quantization

Not supported yet.

3.5.12.1 hybrid_quantization_step1

When using the hybrid quantization function, the main interface called in the first phase is `hybrid_quantization_step1`, which is used to generate the temporary model file (`{model_name}.model`), the data file (`{model_name}.data`), and the quantization configuration file (`{model_name}.quantization.cfg`). Interface details are as follows:

API	hybrid_quantization_step1
Description	Corresponding temporary model files, data files, and quantization profiles are generated according to the loaded original model.
Parameter	dataset: A input data set for rectifying quantization parameters. Currently supports text file format, the user can place the path of picture(jpg or png) or npy file which is used for rectification. A file path for each line. Such as: <code>a.jpg</code> <code>b.jpg</code> or <code>a.npy</code> <code>b.npy</code>
Return	0: success
Value	-1: failure

The sample code is as follows:

```
# Call hybrid_quantization_step1 to generate quantization config
.....
ret = rknn.hybrid_quantization_step1(dataset='./dataset.txt')
.....
```

3.5.12.2 hybrid_quantization_step2

When using the hybrid quantization function, the primary interface for generating a hybrid quantized

RKNN model phase call is `hybrid_quantization_step2`. The interface details are as follows:

API	hybrid_quantization_step2
Description	The temporary model file, the data file, the quantization profile, and the correction data set are received as inputs, and the hybrid quantized RKNN model is generated.
Parameter	<p><code>model_input</code>: The temporary model file generated in the first step, which is shaped like "{model_name}.model". The data type is a string. Required parameter.</p> <p><code>data_input</code>: The model data file generated in the first step, which is shaped like "{model_name}.data". The data type is a string. Required parameter.</p> <p><code>model_quantization_cfg</code>: The modified model quantization profile, which is shaped like "{model_name}.quantization.cfg". The data type is a string. Required parameter.</p>
Return	0: success
Value	-1: failure

The sample code is as follows:

```
# Call hybrid_quantization_step2 to generate hybrid quantized RKNN model
.....
ret = rknn.hybrid_quantization_step2(
    model_input='./ssd_mobilenet_v2.model',
    data_input='./ssd_mobilenet_v2.data',
    model_quantization_cfg='./ssd_mobilenet_v2.quantization.cfg',
)
.....
```

3.5.13 Quantitative accuracy analysis

The function of this interface is inference with quantized model and generate outputs of each layers for quantitative accuracy analysis.

API	accuracy_analysis
Description	Inference with quantized model and generate snapshot, that is dump tensor data of each layers. It will dump a snapshot of both data types include fp32 & qnt for calculate quantitative error.

	<p>Note:</p> <ol style="list-style-type: none"> 1. this interface can only be called after build or hybrid_quantization_step2, and the original model should be a non-quantized model, otherwise the call will fail. 2. The quantization method used by this interface is consistent with the setting in config.
Parameter	<p>inputs: the path list of image or numpy.ndarray.</p> <p>output_dir: output directory, all snapshot data will stored here.</p> <p>If the target is not set, the output directory structure is as follows:</p> <pre> — entire_qnt — fp32 — order.txt — error_analysis.txt </pre> <p>The meaning of each file/directory is as follows:</p> <ul style="list-style-type: none"> ● Directory entire_qnt: Save the results of each layer when the entire quantitative model is fully run (The output has been converted to float32). ● Directory fp32: Save the results of each layer when the entire floating-point model is completely run down. ● order.txt: Record the order of each layout output. ● File error_analysis.txt: Record the cosine distance (entire_error and per_layer_error) between each layer result and the floating-point model during the complete calculation of the quantized model. The different of entire_error/per_layer_error is the input of each layer is come from the quantization model or floating-point mode. <p>calc_qnt_error: whether to calculate quantitative error. (default is True)</p>
Return	0: success
Value	-1: failure

The sample code is as follows:

```

.....

# Create RKNN object
rknn = RKNN(verbose=True)

print('--> config model')
rknn.config(mean_values=[128, 128, 128], std_values=[128, 128, 128], )
print('done')

# Load model
print('--> Loading model')
ret = rknn.load_tensorflow(tf_pb='mobilenet_v1.pb',
                           inputs=['input'],
                           outputs=['MobilenetV1/Logits/SpatialSqueeze'],
                           input_size_list=[[1, 224, 224, 3]])

if ret != 0:
    print('Load mobilenet_v1 failed!')
    exit(ret)
print('done')

# Build model
print('--> Building model')
ret = rknn.build(do_quantization=True, dataset='dataset.txt')
if ret != 0:
    print('build mobilenet_v1 failed!')
    exit(ret)
print('done')

print('--> Accuracy analysis')
rknn.accuracy_analysis(inputs=['./dog_224x224.jpg'], output_dir=None)

.....

```

3.5.14 Register Custom OP

Not supported yet.

3.5.15 Query RKNN model runnable platform

Not supported yet.
